

EVENTX

College Event Management System

User Guide

What this guide covers

A practical, screen-by-screen guide for administrators, organizers, and students. It explains the full event lifecycle from creation and approval to registration, attendance, feedback, certificates, analytics, and reporting.

Repository-ready documentation

Version: September 2026

1. EventX at a Glance

EventX is a college event management application designed around a shared workflow between three main roles: Admin, Organizer, and Student.

Role	Primary responsibilities	Typical screens
Admin	Approve events, manage system resources, sponsors, users, and reports.	Admin Dashboard, Pending Approvals, Resources, Sponsorship, Reports
Organizer	Create and operate events, communicate with participants, manage attendance and event operations.	Command Center, Announcements, Checklist, Volunteers, Budget, Risks, Resources
Student	Discover events, register, receive notifications, attend, submit feedback, and download certificates.	Events, My Events, QR, Notifications, Feedback, Certificates

The application supports both ordinary college events and competition-style events. Administrative and organizer tools are kept separate from student-facing actions so each role sees the parts of the workflow relevant to it.

Recommended mental model

Think of every event as moving through a lifecycle: plan -> submit -> approve -> register -> prepare -> attend -> evaluate -> certify -> report.

Core modules

Authentication, event management, approval, venue management, registrations, cancellation/waitlist, notifications, QR attendance, multiple attendance sessions, certificates, feedback, calendar, analytics, volunteers, budgets, risks, announcements, gallery, competitions, teams, rounds, scores, leaderboard, resources, checklist, sponsorship, and reports.

2. Getting Started

This section describes the normal first-use flow for a new user.

1. Open the EventX application in a browser.
2. Use the login screen to sign in with the account supplied for your role.
3. After login, use the role-specific dashboard or navigation to open the required module.
4. Before creating or editing anything, verify that the correct account and role are active.
5. Use the normal browser navigation or the application's navigation links to return to previous sections.

Basic navigation habits

Action	What to do
Open a module	Use the visible dashboard or navigation button for that module.
Submit a form	Complete required fields, review values, then use the form's save/submit button.
Confirm a change	Look for the success or information message after the action.
Handle an error	Read the displayed message, correct the field or permission issue, and retry.
Return to the dashboard	Use the dashboard/home navigation provided by the current role.

Important

EventX contains role and ownership checks. A user may see a 403 Forbidden page when trying to access a module that belongs to another role or another organizer.

3. Roles and Access

EventX separates actions by role. This prevents a student account from performing administrative operations and prevents organizers from managing events owned by other organizers.

Area	Student	Organizer	Admin
Student event registration	Yes	No	No
Create/manage own event	No	Yes	Role-dependent admin tools are separate
Approve events	No	No	Yes
Sponsorship management	No	No	Yes
System resource management	No	Request/use	Yes
Attendance operations	No	Yes	Supported by admin attendance tools
Generate event certificates	No	Yes for owned event	Yes
Reports	No	Event operations/analytics	Yes

Ownership is an additional layer. For organizer functions, the account must normally be the owner of the event being managed. This matters especially for attendance, analytics, volunteers, budgets, risks, resources, checklists, and event operations.

What a 403 means

The request reached the application, but the current account is not authorized for that action. Re-check the logged-in account and the event ownership before troubleshooting anything else.

4. Admin Dashboard

The Admin Dashboard is the control center for system-level operations.

Common dashboard actions include:

Pending Approvals, All Events, Users, Clubs, Venues, Resources, Resource Requests, Sponsorship, and Reports.

1. Log in with an admin account.
2. Open the Admin Dashboard.
3. Select the module required for the task.
4. After making a change, confirm the success message and return to the dashboard or continue with the next task.

Button / area	Use it for
Pending Approvals	Review events waiting for administrative approval.
All Events	Review the system's event records.
Users	Review registered user accounts.
Clubs	Review club-related information.
Venues	Manage venue records and availability.
Resources	Manage shared event resources.
Resource Requests	Review organizer requests for resources.
Sponsorship	Add and manage sponsor records for events.
Reports	Choose an event and generate summary reports/PDF output.

5. Event Approval

Organizer-created events can enter an approval workflow before they are treated as approved events.

1. Open **Pending Approvals** from the Admin Dashboard.
2. Review the event details, including title, timing, venue, and organizer information shown by the application.
3. Use the available approval action for the event.
4. Return to the event list or dashboard and verify the event's updated status.

Why the approval step matters

It provides a central checkpoint for college administration before events become part of the student-facing event flow. It also gives the system a natural place to handle venue, timing, and operational review.

Recommended review order

Check event identity first, then date/time, venue, capacity, registration deadline, and organizer details. Resolve obvious conflicts before approving.

After approval

The organizer can continue operational preparation while students can use the student-facing event workflow according to the event's configuration.

6. Users, Clubs, and Venues

These administrative sections help maintain the supporting data used by events.

Users

1. Open Users from the Admin Dashboard.
2. Review account records and role information available in the interface.
3. Use the account data to verify that staff, organizers, and students are assigned correctly.

Clubs

1. Open Clubs.
2. Review the listed club records used by the event system.
3. Keep club information consistent with the event organizers and college structure.

Venues

1. Open Venues.
2. Add or maintain venue records used when creating events.
3. Check timing and venue combinations during event review to reduce scheduling conflicts.

Best practice

Keep venue names standardized. Consistent naming makes event selection, conflict checks, reporting, and administration easier.

7. Resource Management

Resource Management tracks shared resources and organizer requests for them.

Admin workflow

1. Open **Resources** from the Admin Dashboard.
2. Maintain the resource name, available quantity, and description.
3. Open **Resource Requests** to review requests linked to events.
4. Approve or manage requests using the controls provided by the application.

Organizer workflow

1. Open the event's resource section.
2. Select an available resource and enter the required quantity.
3. Submit the request.
4. Check the request status after administrative review.

Notifications

Resource requests can notify admin users so that requests are visible without requiring an administrator to manually check every event.

8. Sponsorship Management

Sponsorship records are managed from the Admin Sponsorship area.

A sponsor record can contain:

Sponsor name, contribution amount, contact information, promised benefits, and status such as Prospective.

1. Open **Sponsorship** from the Admin Dashboard.
2. Choose the event that the sponsor belongs to.
3. Enter the sponsor's name and contribution amount.
4. Add contact information and promised benefits.
5. Choose the appropriate status.
6. Save the sponsor record.
7. Verify the new sponsor appears in the sponsor list.

Deleting a sponsor

Use the delete control for the specific sponsor record. Confirm the record disappears from the list and the application displays the resulting status message.

Data quality

Use a numeric contribution amount and complete the contact/benefits fields consistently so sponsorship information remains useful in reports and event administration.

9. Reports and PDF Reports

Admin Reports provide a consolidated view of an event.

A report can include event summary information, registration summary, department participation, feedback data, participant information, attendance/certificate-related information, and a PDF download option.

1. Open **Reports** from the Admin Dashboard.
2. Select the event you want to inspect.
3. Review the displayed metrics and participant table.
4. Review the feedback and participation information shown for that event.
5. Use **Download PDF** to generate the report document.
6. Open the downloaded PDF and verify that the event name and summary information match the selected event.

Useful final-stage workflow

Reports are most useful after registration, attendance, feedback, and certificate processing have been completed, because more of the event lifecycle is then represented in the output.

10. Organizer: Creating an Event

Organizers begin the event lifecycle by creating an event with the information needed for approval and student registration.

1. Log in using an organizer account.
2. Open the event creation form.
3. Enter the event title and description.
4. Choose the venue and event date/time.
5. Set participant capacity and registration deadline.
6. Complete any additional event fields presented by the form.
7. Submit the event for administrative review.

Before submitting

Check	Why
Title and description	Students need clear event information.
Date and time	Prevents confusion and supports calendar/attendance planning.
Venue	Connects the event to the venue management system.
Capacity	Controls registration and waitlist behavior.
Registration deadline	Controls when students can register.

11. Organizer Command Center

After an event exists, the Command Center acts as the organizer's operational workspace.

Typical tools include registration information, attendance actions, analytics, announcements, volunteers, budget, risks, resources, checklist, gallery, competition tools, and other event-specific actions.

1. Open the event from your organizer event list.
2. Enter the Command Center for the selected event.
3. Use the quick actions for the most common tasks.
4. Use the dedicated modules when planning or managing the event in more detail.

Recommended sequence

Set up the event first, then prepare the checklist/resources, communicate with participants, monitor registrations, run attendance, and finish with feedback, certificates, and analytics.

The Command Center is event-specific. Keep the correct event selected when switching between modules so that updates are applied to the intended event.

12. Organizer Checklist

The checklist helps organizers track preparation tasks for an event.

1. Open the event's **Checklist** area.
2. Enter a task title, such as venue setup, projector check, volunteer briefing, or certificate review.
3. Save the task.
4. Mark the task completed when the work is finished.
5. Review the remaining unchecked tasks before the event begins.

A simple preparation structure

Stage	Example tasks
Before promotion	Confirm venue, capacity, registration deadline.
Before event day	Check equipment, volunteers, resources, announcements.
Event day	Open attendance, verify QR workflow, monitor participants.
After event	Collect feedback, generate certificates, review analytics, create final report.

Tip

Use short task titles. A checklist is most useful when an organizer can scan it quickly and immediately see what remains unfinished.

13. Volunteers, Budget, and Risks

These modules support event operations beyond registration and attendance.

Volunteers

1. Open the event's volunteer management section.
2. Add volunteer assignments and review the event's volunteer records.
3. Use the records to coordinate responsibilities during event preparation and execution.

Budget

1. Open the event's budget section.
2. Record budget items and amounts as required by the interface.
3. Review planned spending against the event's needs.

Risks

1. Open the event's risk section.
2. Record relevant risks and the mitigation information requested by the form.
3. Review important risks before event day.

Use these together

Checklist shows work remaining; volunteers show responsibility; budget shows planned costs; risks show issues that need mitigation. Together they provide a practical event-operations view.

14. Announcements and Notifications

Organizers can communicate with registered students using announcements, while EventX also produces system notifications for important events in the workflow.

Organizer announcement workflow

1. Open the event's announcement/communication area.
2. Enter an announcement title.
3. Enter the message for registered students.
4. Send the announcement.
5. Confirm the application displays a successful send state.

Student notification workflow

Students can open the notification panel from the bell icon and review recent notifications. Registration confirmations, waitlist updates, event-related messages, and other system actions may appear there.

Unread notifications

Use the notification panel regularly during an active event. Notifications are user-specific and are stored by the application so important messages do not depend on the user seeing them at exactly the moment they are created.

15. Student: Browse and Register

Students use the event listing to discover events and register for available ones.

1. Log in with a student account.
2. Open the event list.
3. Review an event's title, timing, venue, capacity, and other visible information.
4. Choose the event's registration action.
5. After successful registration, look for the confirmation message and notification.
6. Open My Events to review your registrations.

Registration rules

The application checks whether the student already has an active registration and whether the registration deadline has passed. The event's participant capacity also controls whether the new registration is registered or waitlisted.

Avoid duplicate registration

A student should use My Events to review existing registrations before attempting to register again for the same event.

16. Waitlist and Cancellation

When an event reaches its participant capacity, additional students can be placed on the waitlist.

1. Attempt registration after the event has reached its maximum active capacity.
2. The application records the student as waitlisted instead of registered.
3. The student can monitor the registration state from My Events/notifications.
4. When a registered student cancels, the system checks the waitlisted registrations.
5. The first eligible waitlisted student is promoted to registered status.
6. The promoted student receives a notification and can access the normal registered-event workflow.

Important behavior

Promotion is triggered by a cancellation that frees a seat. A promoted student should check the event status and then use the QR/attendance flow like other registered participants.

For event organizers, this means capacity settings should be chosen carefully before registration starts.

17. QR Attendance

QR attendance connects a registered student to an organizer's check-in action.

Student side

1. Open the registered event in My Events.
2. Open the event's QR/check-in code when available.
3. Present the code to the organizer during check-in.

Organizer side

1. Open the event's attendance area.
2. Use the QR attendance action to scan or process the student's code.
3. Verify the registration and selected attendance session.
4. Confirm the successful check-in response.
5. Review attendance records or analytics as needed.

Multiple sessions

EventX supports session labels for attendance, allowing check-ins to be recorded for separate sessions instead of treating the entire event as one undifferentiated attendance record.

18. Feedback and Certificates

The end of an event can include two important participant-facing steps: feedback and certificates.

Feedback

1. Open the completed/attended event from the student-facing area.
2. Open the feedback section when it is available.
3. Complete the requested rating/comments fields.
4. Submit the feedback and confirm the success state.

Certificates

1. The organizer/admin generates certificates for eligible registered attendees who have attendance records.
2. The student receives a notification when the certificate is generated.
3. Open the certificate from the student's certificate area or provided link.
4. Download the certificate PDF.

Eligibility workflow

Certificate generation is tied to attendance. Organizers should complete attendance processing before generating the event's certificates.

19. Competitions, Teams, and Leaderboard

Competition-oriented events use additional records for teams, rounds, scores, and rankings.

1. Open the competition tools for the event.
2. Create or manage teams using the available team controls.
3. Set up competition rounds.
4. Enter authorized scores for the appropriate participants/teams.
5. Review the leaderboard generated from the score records.
6. Use the leaderboard as the event's current ranking view.

Useful operating pattern

Phase	Action
Registration	Collect participants/teams as supported by the competition workflow.
Preparation	Configure the required rounds.
Execution	Record scores for the correct round and participant/team.
Review	Check score entries and leaderboard output.
Reporting	Use reports and event records for the final documentation.
Score safety	Only authorized organizer/admin operations should be used for score entry. Always verify the selected round and participant/team before saving a score.

20. Calendar and Analytics

Calendar and analytics provide the overview needed to plan and evaluate events.

Calendar

1. Open the calendar view.
2. Select or inspect events by date.
3. Use the calendar to identify scheduling patterns and event timing.

Analytics

1. Open the event's analytics/attendance dashboard.
2. Review registration counts, attendance information, and other metrics displayed by the application.
3. Compare participation with event capacity and registration activity.
4. Use the observations to support final event reporting.

Operational use

Calendar helps with planning; analytics helps with evaluation. Use both together when preparing recurring college events or comparing attendance with registration.

21. Full End-to-End Workflow

This is the recommended way to demonstrate EventX from beginning to end.

Stage	Role	Main action
1	Organizer	Create event and submit it for approval.
2	Admin	Review and approve the event.
3	Organizer	Prepare checklist, resources, volunteers, budget, and announcements.
4	Student	Browse and register.
5	Organizer	Monitor registrations and communicate with participants.
6	Student/Organizer	Use QR attendance for check-in.
7	Organizer	Review attendance and analytics.
8	Student	Submit feedback after participation.
9	Organizer/Admin	Generate eligible certificates.
10	Admin	Generate the final event report and PDF.

Why this flow works well

It demonstrates that EventX is not only a registration page. Each role contributes to a shared event lifecycle and the records created earlier are reused by later stages.

22. Troubleshooting

Problem	What to check first
403 Forbidden	Confirm the logged-in role and confirm the organizer owns the event.
Cannot register	Check existing registration, registration deadline, and event capacity.
Student is waitlisted	Check whether the event is already at capacity.
Promoted student cannot use QR	Confirm the registration now shows registered status.
No certificate	Confirm the student has a qualifying attendance record and the organizer/admin generated certificates.
Announcement not visible	Confirm it was sent to registered students and check the notification area.
Resource request not progressing	Check its status in Resource Requests and wait for the admin action.
PDF report looks incomplete	Verify the selected event and whether the corresponding registration/attendance/feedback records exist.
Wrong event appears selected	Return to the event list/Command Center and reopen the intended event.

For local development issues, also check that the Flask application is running and that the browser is connected to the correct local address.

Safe recovery

When an unexpected error occurs, avoid repeated clicks that could create duplicate records. Refresh once, inspect the resulting status, and continue from the relevant module.

23. GitHub Repository Guide

This PDF is intended to be placed directly in the EventX GitHub repository as user documentation.

Suggested repository structure

Path	Purpose
README.md	Project overview, setup, and quick start.
docs/EVENTX_USER_GUIDE.pdf	This complete user guide.
templates/	Flask/Jinja interface templates.
static/	CSS, JavaScript, images, and other frontend assets.
app.py	Flask application routes and application logic.
models.py	Database models and relationships.
instance/	Local runtime/database files; keep private/local data out of public repositories as appropriate.

Suggested README link

Add a Documentation section in README.md and link to **docs/EVENTX_USER_GUIDE.pdf**. This lets a reviewer open the user manual without searching through the source tree.

Release checklist

Before publishing: verify the repository contains no credentials or private database data, confirm the application starts cleanly, and ensure the guide describes the current UI.

END OF USER GUIDE

EventX - College Event Management System
